### 10. DISPLAY CONTROL INSTRUCTION

The LCD module has built in a T6963C. LSI controller, It has an 8-bit parallel data bus and control lines for writing or reading through an MPU interface, it has a 128-word character generator ROM (refer to table 1.), which can control an external display RAM of up to 8K bytes. Allocation of text, graphics and external character generator RAM can be made easily and the display window can be moved freely within the allocated memory range.

- **RAM Interface**

The external RAM is used to store display data (text, graphics and external CG data). It can be freely allocated to the memory area (8K byte max).

### Flowchart of communications with MPU

(1) Status Read

A status check must be performed before data is read or written.

Status check

The Status of T6963C can be read from the data lines.

$\overline{\text{RD}}$	L
$\overline{\text{WR}}$	H
$\overline{\text{CE}}$	L
C/D	H
D0 to D7	H

The T6963C status word format is as follows:

MSB							LSB
STA7	STA6	STA5	STA4	STA3	STA2	STA1	STA0
D7	D6	D5	D4	D3	D2	D1	D0

STA0	Check command execution capability	0:Disable 1:Enable
STA1	Check data read/write Capability	0:Disable 1:Enable
STA2	Check Auto mode data read capability	0:Disable 1:Enable
STA3	Check Auto mode data write capability	0:Disable 1:Enable
STA4	Not used	
STA5	Check controller operation capability	0:Disable 1:Enable
STA6	Error flag. Used for Screen Peek and Screen copy commands.	0:No Error 1:Error
STA7	Check the blink condition.	0:Disable off 1:Normal display

(Note 1) It is necessary to check STA0 and STA1 at the same time.

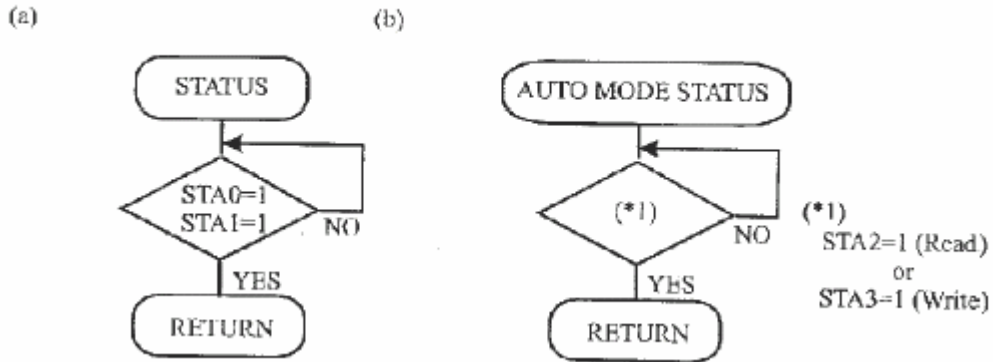

There is a possibility of erroneous operation due to a hardware interrupt.

(Note 2) For most modes STA0/STA1 are used as status check.

(Note 3) STA2 and STA3 are valid in Auto mode; STA0 and STA1 are invalid.

## MODEL NO : ASI\_-24012BF-KJ-\_YD/X

Status Checking flow

- (Note 4) When using the MSB=0 command, a Status Read must be performed.  
 If a status check is not carried out, the T6963C cannot operate normally, even after a delay time.  
 The hardware interrupt occurs during the address calculation period (at the end of each line)  
 If a MSB=0 command is sent to the T6963C during this period, the T6963C enters Wait status.  
 If a status check is not carried out in this state before the next command is sent, there is the possibility that the command or data data will not be received.

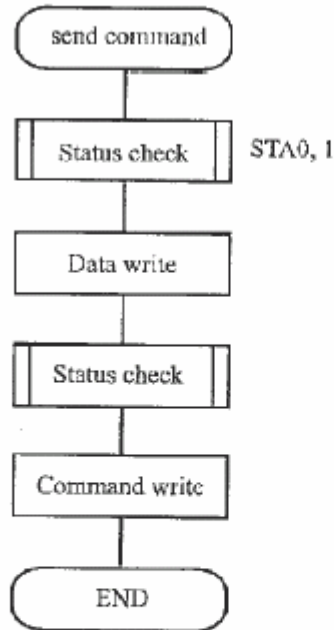

**MODEL NO : ASI\_-24012BF-KJ-\_YD/X**

(2) Setting date

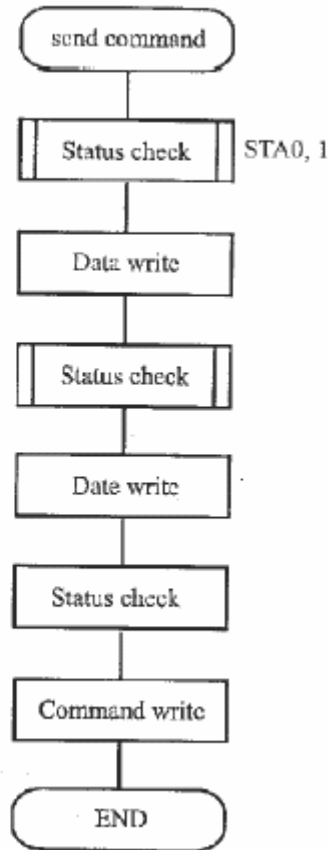

When using the T6963C, first set the data, then set the command.

Procedure for sending a command

(a)The case of 1 date

(b)The case of 2 data

(Note) When sending more than two data, the last datum (or last two data) is data.

(1) Set Cursor Pointer

The position of the cursor is specified by X ADRS and Y ADRS. The cursor position can only be moved by this command. Data read/write from the MPU never changes the cursor pointer. X ADRS and Y ADRS are specified as follows.

X ADRS 00H to 4FH (lower 7 bits are valid)

Y ADRS 00H to 1FH (lower 5 bits are valid)

Single-Scan

X ADRS 00 to 4FH

Y ADRS 00H to 0FH
-------------------

(2) Set Offset Register

The offset register is used to determine the external character generator RAM area.

The T6963C has a 16-bit address bus as follows.

The T6963 assign External character generator, when character code set 80H to FFH is using internal character generator. Character code 00H to 80H assign External character generator, when External generator mode.

The senior five bits define the start address in external memory of the CG RAM area,. The next eight bits represent the character code of the character. In internal CG ROM, character codes 00H to 7FH represent the predefined "internal" CG ROM characters, and code 80H to FFH represent the user's own "external" characters. In external CG ROM mode, all 256 code from 00H to FFH can be used to represent the user's own characters. The three least significant bits indicate one of the eight rows of either dots that define the character's shape.

1000x 100	TEXT ATTRIBUTE Mode	--
10000x x x	Internal Character Generator Mode	--
10001x x x	External Character Generator Mode	--

The display mode is defined by this command. The display mode does not change until the next command is sent. The logical OR, EXOR, AND of text or graphic display can be displayed. In internal Character Generator mode, character codes 00H to 7FH are assigned to the built-in character generator ROM. The character codes 80H to FFH are automatically assigned to the external character generator RAM.

Example

GRAPHIC

TEXT

"OR"

"AND"

"TXOR"

(Note) Attribute functions can only be applied to text display, since the attribute data is place in the graphic RAM area.

### Attribute Function

The attribute operations are Reverse display, Character blink and Inhibit. The attribute data is written into the graphic area, which was defined by the Set Control Word command. Only text display is possible in Attribute Function Mode; graphic display is automatically disabled. However, the Display Mode command must be used to turn both Text and Graphic on in order for the Attribute function to be available.

The attribute data for each character in the text area is written to the same address in the graphic area. The Attribute function is defined as follows.

10100111	8-line cursor	--

When cursor display is on, this command selects the cursor pattern in the range 1 line to 8 lines.

The cursor address is defined by the Cursor Pointer Set command.

Data Auto Read/Write

CODE	HEX.	FUNCTION	OPERAND
10110000	B0H	Set Data Auto Write	--
10110001	B1H	Set Data Auto Read	--
10110010	B2H	Auto Reset	--

The command is convenient for sending a full screen of data from the external display RAM. After setting Auto mode, a Data Write ( or Read) command is not needed to be sent between each datum. A Data Auto Write (or Read) command must be sent after a Set Address Pointer command. After this command, the address pointer is automatically incremented by 1 after each datum. In Auto mode, the T6963C cannot accept any other commands.

The Auto Reset command must be sent to the T6963C after all data has been sent, to clear Auto mode. (Note) A Status check for Auto mode.

(STA2, STA3 should be checked between sending of each datum. Auto Reset should be performed after checking STA3=1 (STA2=1) Refer to the follow flowchart.

- **Data Read/Write**

CODE	HEX.	FUNCTION	OPERAND
11000000	C0H	Data Write and Increment ADP	--
11000001	C1H	Data Read and Increment ADP	--
11000010	C2H	Data Write and Decrement ADP	--
11000011	C3H	Data Read and Decrement ADP	--
11000100	C4H	Data Write and Nonvariable ADP	--
11000101	C5H	Data Read and Nonvariable ADP	--

This command is used for writing data from the MPU to external display RAM, and reading data from external display RAM to the MPU. Data Write/Data Read should be executed after setting address using Set Address Pointer command. The address pointer can be automatically incremented or decremented using this command.

(Note) This command is necessary for each 1-byte datum.

Refer to the following flowchart.

### Screen Peek

CODE	HEX.	FUNCTION	OPERAND
11100000	E0H	Screen Peek	-e

This command is used to transfer 1 byte of displayed data to the data stack; this byte can then be read from the MPU by data access. The logical combination of text and graphic display data on the LCD screen can be read by this command.

The status (STA6) should be checked just after the Screen Peek command. If the address determined by the Set Address Pointer command is not in the graphic area, this command is ignored and a status flag (STA6) is set.

Refer to the following flowchart.

- **Screen copy**

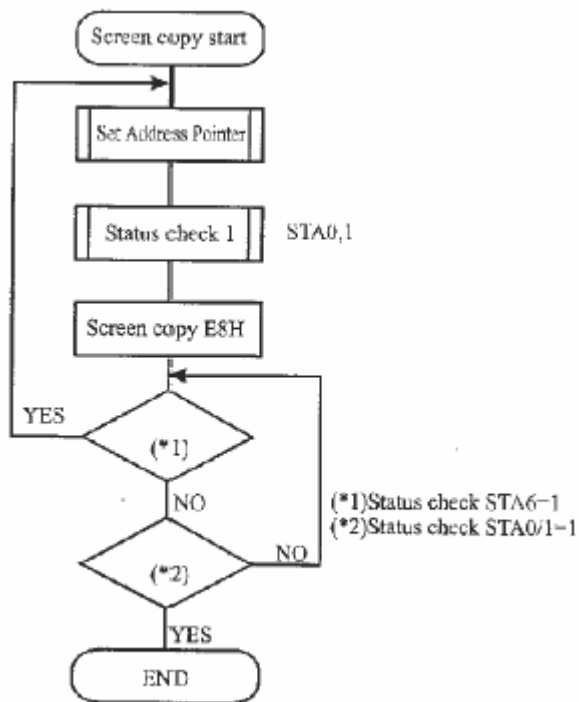

CODE	HEX.	FUNCTION	OPERAND
11101000	E8H	Screen Copy	--

This command copies a single raster line of data to the graphic area.

The start point must be set using the Set Address Pointer command.

(Note 1) If the attribute function is being used, this command is not available.  
(With Attribute data is graphic area data.)

Refer to the following flowchart.

1111x 101	Bit 5	--
1111x 110	Bit 6	--
1111x 111	Bit 7 (MSB)	--

X:invalid

This command use to set or reset a bit of the byte specified by the address pointer.

Only one bit can be set or reset at a time.

Refer to the following flowchart.
